

**53%**  
of users will remove  
a mobile app for  
consistent crashes

# Crash analytics

**Capture, prioritize, analyze, and reproduce all crashes experienced by your users. Get the full visibility you need to resolve crash issues or validate your fix by leveraging the automatic user action trail.**

AppPulse Mobile captures all crashes for you. It also lets you report crashes on your own. With the Crash Analytics Tool, you can focus on the user action that had the most users experiencing crashes, then drill down and view the crash logs to identify the exact code that failed. You can identify key device state metrics that could be the root cause for the crash, such as low memory or jail-broken/rooted device.

Finally, you can explore the user flow of actions that led to the crash. The crash trail will display user actions, and you can seed breadcrumbs in the code using the AppPulse API to help you isolate suspects that caused the crash. You'll have a full holistic picture and tools to help you get to the crash root cause.
