

DevOps: the journey to continuous everything

Four keys to starting your DevOps journey

Application development and IT operations teams travel different roads with different points of view.

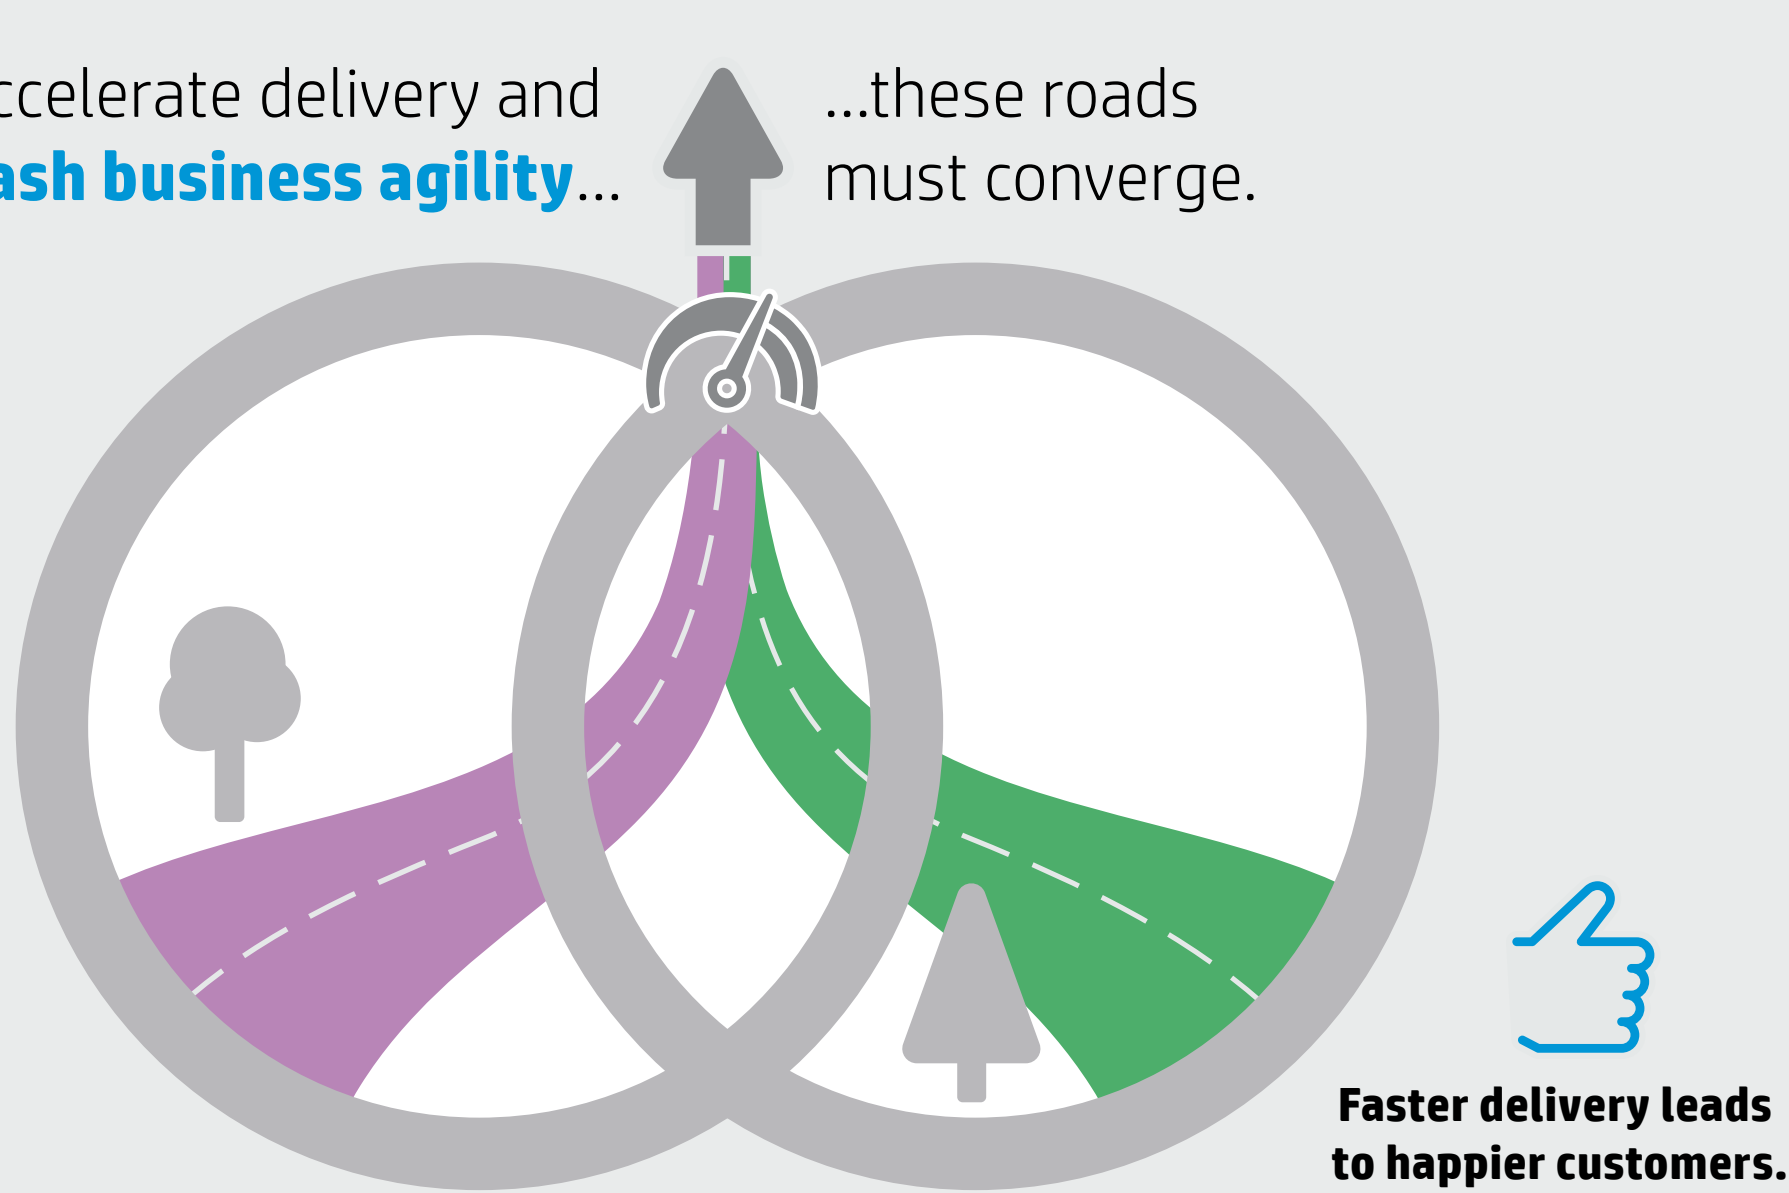

“Relations between Development and Operations are generally viewed as poor, with some even characterized as toxic.”

—Gartner¹

To accelerate delivery and **unleash business agility**...

...these roads must converge.

“By 2016, 40% of App Dev organizations will have joint initiatives with operations in support of continuous delivery and simplified release management.”

—Gartner²

Four key steps to launching your DevOps journey

1 Assess your DevOps strategy

“What are we trying to achieve?”

- Identify your DevOps business drivers and challenges
- Examine critical success factors and best practices
- Review critical DevOps areas that align with your business goals
- Identify priorities for short, midsize, and long-term projects

2 Identify the DevOps maturity of your core dev and IT ops processes

“How far along are we?”

- Identify key stakeholders in business, development, QA, and operations
- Determine communication plan for stakeholders
- Understand the app development methodologies—Agile, waterfall, both—that are most important
- Determine the IT processes that are most important

3 Determine standards and automation for continuous everything

“Where can we change?”

Evaluate your processes and implement areas for:

- Continuous assessment
- Continuous integration and testing
- Continuous release and deployment
- Continuous delivery

4 Establish measures/metrics for successful DevOps

Identify business-driven metrics, such as:

- Accelerate time to market
- Increase revenue
- Improve customer satisfaction

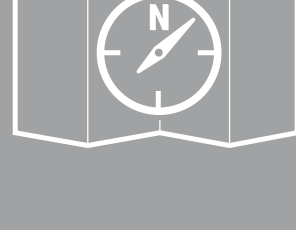

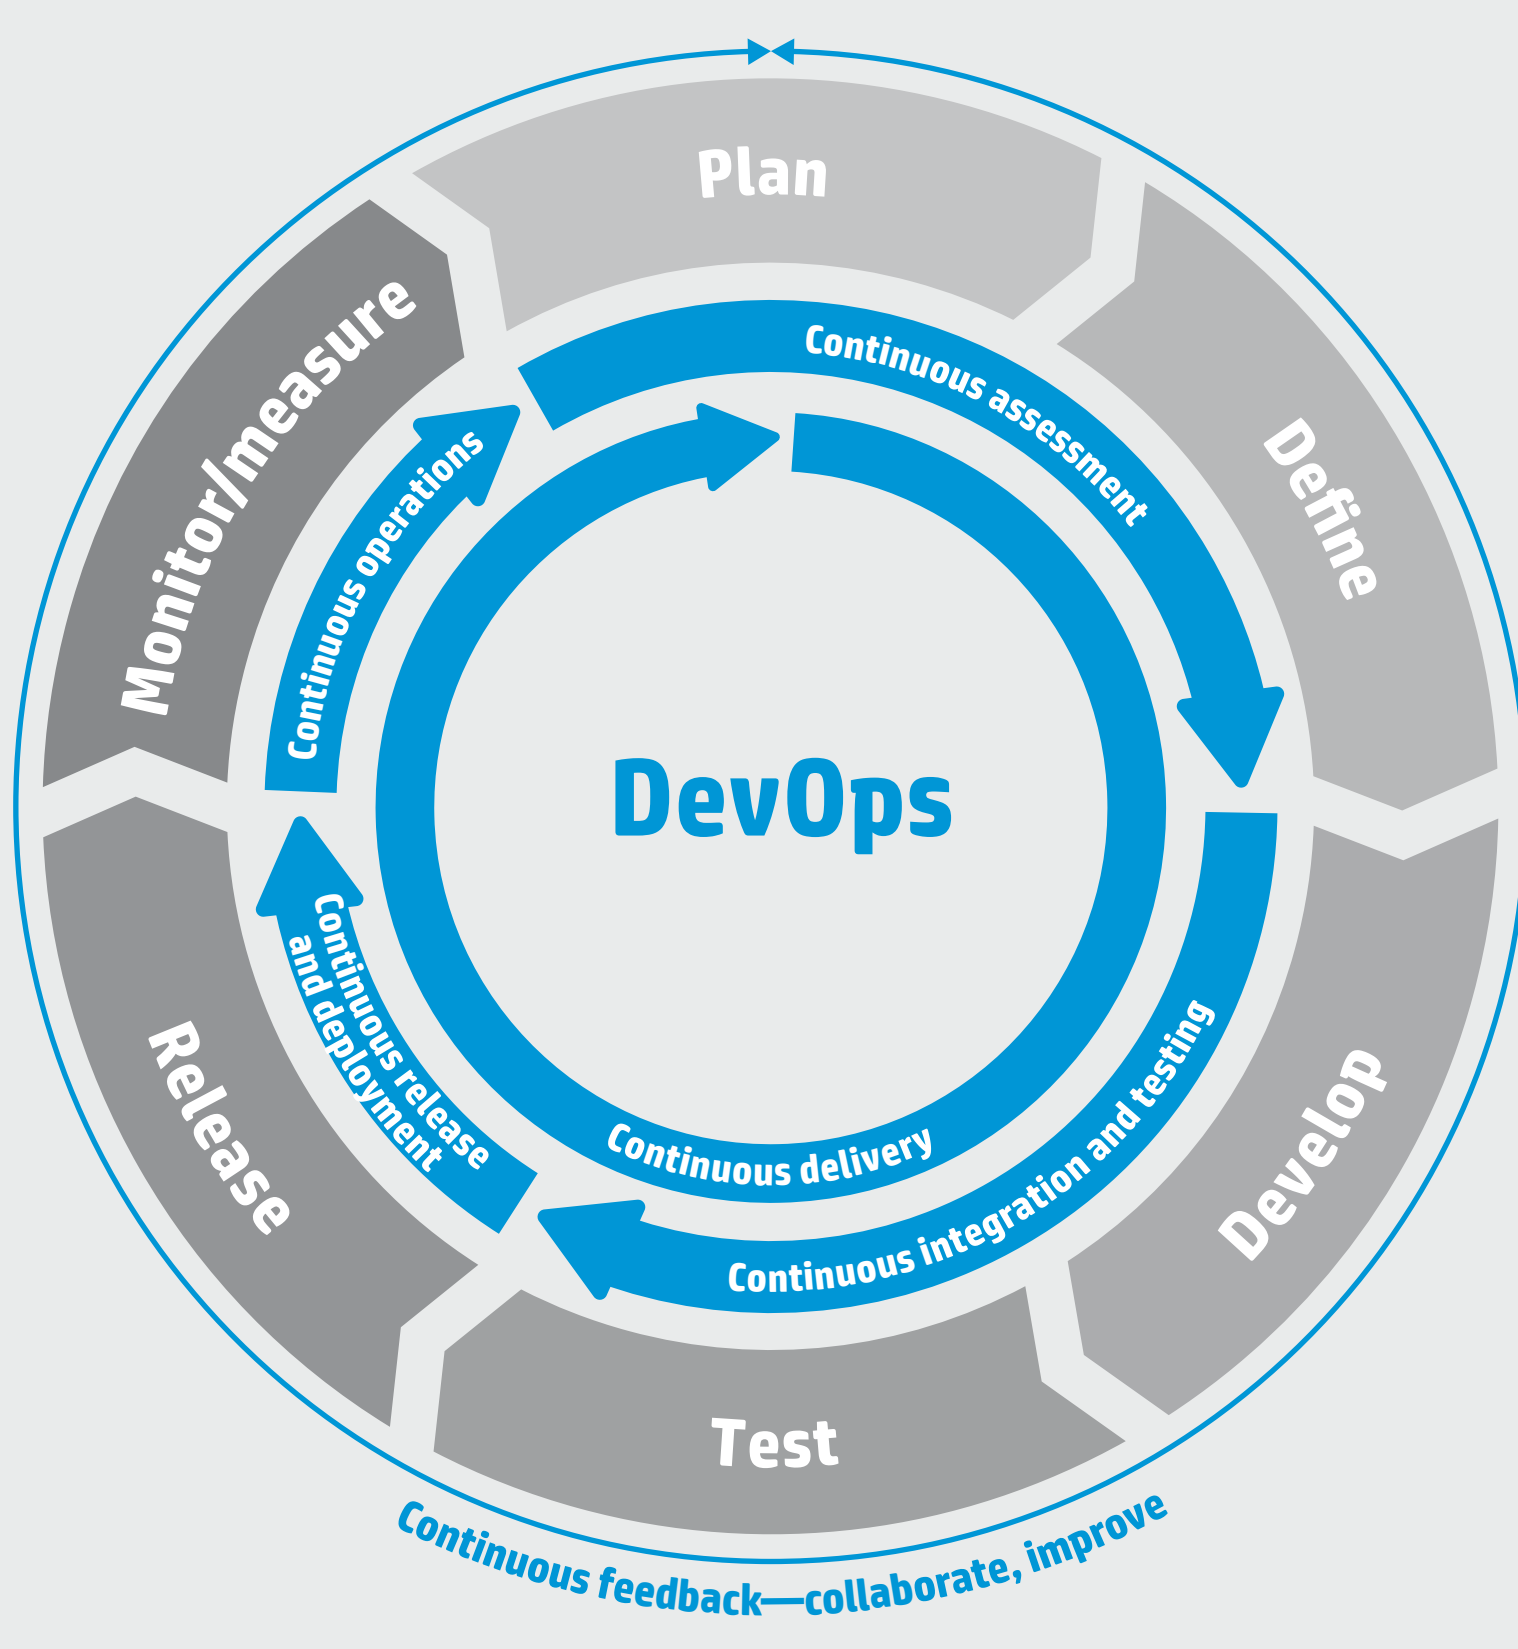

“What will our results look like?”

“Build new shared metrics that align with the business needs and impacts, but, more importantly, help people realize that they must work together.”

—Gartner³

HP Software Professional Services: A **holistic approach** to DevOps

Drawing on years of experience as a trusted advisor, we cover the entire roadmap for your DevOps journey—from planning through operation.
